Performing Layer Adjustments With a single click of the Layers palette or the Image Adjustments menu, you can make a wealth of changes to your image. Here are some common layer adjustments:
* Layer-based Filters * Graduated Filter * Paint Bucket * Lasso tool * Shadows and Highlights (or Dodge and Burn) * Levels and Curves * Matte and Sponge Options ##
Converting from RGB to Grayscale Sometimes you may need to convert a color image from RGB to grayscale. The Grayscale command is in the Image Adjustments menu. Most of the adjustments found in Image Adjustments are layer based, so you may need to create a copy of the layer you want to adjust so that you can work on the original layer and also a new one that you use to edit only the conversion. ##
Using Adjustment Layers and Layers Panel One of the best features of the Layers palette is the Adjustment Layers palette (Figure 6-2). Choose Layer ► New Adjustment Layer and a new layer appears on the active layer. Figure 6-3 shows the Use Layer Mask option in the Adjustment Layers panel. FIGURE 6-2: The Adjustment Layers palette enables you to quickly create a layer to help you change one or more aspects of an image. FIGURE 6-3: The Use Layer Mask option in the Adjustment Layers panel makes it easy to create a layer mask to hide parts of a layer to easily edit only certain areas of an image. The Layers panel enables you to control the visibility of each layer, but you can make changes to all the layers in the image simultaneously. To make changes to a selection, use the Selection and Direct Selection tools, and then move the cursor over the area you want to select. Press the OK button to enter the Direct Selection mode, and then click to select the area you want. Figure 6-4 offers two views of the Layers panel. As the name suggests, it enables you to display the layers in two ways

Your new document should look like this: 2. Open an Image To open an image in Photoshop Elements, click File > Open. The Open dialog box opens and allows you to navigate to the folder and the image to open. 3. Navigate to the Folder The Get External Data dialog box opens to show you the list of available folders on your computer. Choose the folder where you saved your image from the list. 4. Choose the Image The Open dialog box shows the image you want to edit. Click the Open button to open the image. 5. Apply Basic Editing Before you start editing, make sure the image is aligned on the Canvas. To do this, select the image by clicking the image area, then press and hold Shift, the Caps Lock key or the Control key on your keyboard. Then drag the image to the left or right until it snaps to the window frame. After you've aligned your image, the image is ready for editing. 6. Apply Basic Editing Type a new name for the image into the Name box and press Enter to rename the file. Add a description of the image if you like. 7. Remove Unwanted Areas Click the Selection tab at the top of the Photoshop Elements window to open the Selection tool's toolbox. There are several selection tools: lasso, magic wand, and paintbrush. ic infection with increased TNF α expression is associated with poorer prognosis in patients with HCC following resection ([@b5-ol-0-0-11404]). Besides, IRE1 α is activated in response to endoplasmic reticulum (ER) stress, which is thought to lead to mTOR activation ([@b32-ol-0-0-11404]). In normal cells, mTOR acts as a critical regulator of cell proliferation and metabolism, while its aberrant activation promotes cell proliferation and tumorigenesis ([@b33-ol-0-0-11404]). Overexpression of IRE1 α is reported in colorectal cancers (CRCs), and inhibition of IRE1 α suppressed cell proliferation ([@b34-ol-0-0-11404]). Kise *et al** ([@b35-ol-0-0-11404]) reported a mechanism whereby high expression of IRE1 α in CRC cells induced cell proliferation via the mTOR pathway. These results suggest that the mechanism of IRE1 α -mediated proliferation may be associated with the mTOR signaling pathway. Additionally, IRE1 α is associated with cancer recurrence and metastasis, as well as drug resistance in many cancer types. Madhok *et al** ([@b36-ol-0-0-11404]) reported that overexpression of IRE1 α was present in CRC, and upregulated IRE1 α inhibited apoptosis and promoted proliferation in CRC. In the present study, at a transcriptional level, IRE1 α was upregulated in HCC tissues compared with paracarcinoma tissues, which was consistent with previous studies, suggesting that high expression of IRE1 α is associated with poor prognosis in patients with HCC. In the present study, ROC analysis of IRE1 α expression revealed that serum levels of IRE1 α were closely correlated with the tumor size and tumor number in patients with HCC. These results further verified that high expression of IRE1 α was associated with HCC progression. In addition, IRE1 α expression was found to be highly correlated with TNM stage in patients with HCC, and was significantly associated with tumor size. The results of ROC curve analysis suggested that the relative expression level of IRE1 α in the serum may serve as a valuable biomarker for tumor size, tumor number and TNM stage in patients with HCC.

The chicken ovary secretes the yolk-protein precursor vitellogenin, which then enters the developing oocytes where the yolk precursor is processed and packaged. While biosynthetic studies have indicated that the 'preformed' yolk protein precursors are not synthesised by the oocyte, the hormonally driven yolk proteins are generally accepted to be synthesised in the oocyte. To determine whether the yolk protein precursors are biosynthesised in the oocyte, or whether they are biosynthesised elsewhere and transferred to the oocyte as preformed organelles, the present study characterised the hormone receptors involved in controlling the biosynthesis and release of v
